# E. M. WAVES & MOMENTUM

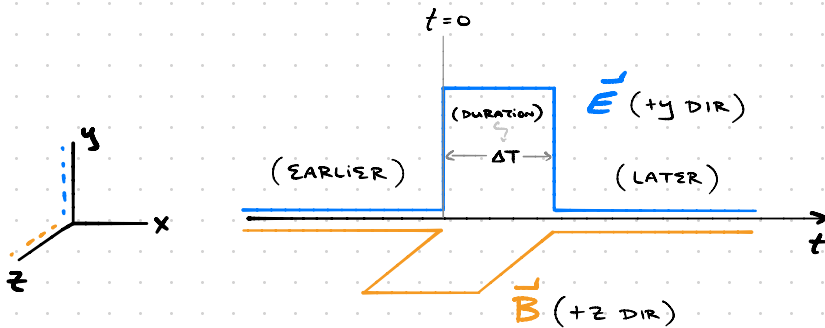

- IN QUESTIONS #1 & #2 WE WILL LOOK @ HOW AN E.M. WAVE CAN TRANSFER MOMENTUM TO PARTICLES ALONG THE DIRECTION  $\hat{n}$  OF THE WAVE'S PROPAGATION, EVEN THOUGH THE  $\vec{E}$  &  $\vec{B}$  FIELDS ARE BOTH  $\perp$  TO  $\hat{n}$ :

Q1 A PROTON IS SITTING @ REST AT SOME POINT ( $x=0, y=0, z=0$ ) IN SPACE:

• CONSIDER AN E.M. WAVE THAT IS SHAPED LIKE A RECTANGULAR PULSE TRAVELING IN THE +X DIRECTION, SO THAT ANYWHERE IN THE  $x=0$  PLANE, THE  $\vec{E}$  &  $\vec{B}$  FIELDS HAVE THE FOLLOWING TIME DEPENDENCE:

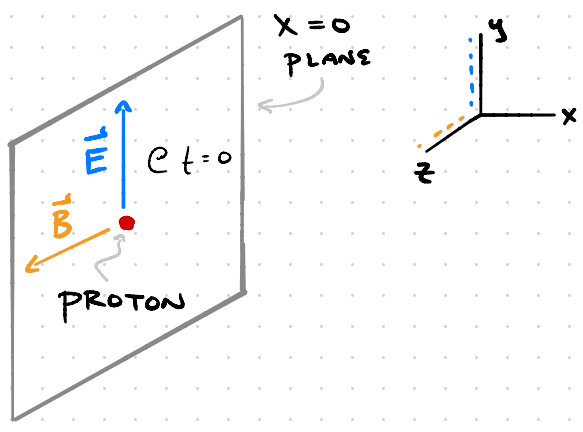

IN CASE  
YOU FORGOT

$$\vec{F}_{EL} = q \times \vec{E}$$

$$\vec{F}_{BL} = q \times v \times B \times \sin\theta, \quad \vec{F}_{BL} \perp \vec{v}, \vec{B} \quad (\text{RHR \# 1})$$

a) @  $t=0$ , THE FORCE ON THE PROTON COMES ENTIRELY FROM THE  $\vec{E}$  FIELD.

- WHY IS THERE NO FORCE APPLIED BY THE  $\vec{B}$  FIELD @  $t=0$ ?
- WHAT IS THE DIRECTION OF THE FORCE ON THE PROTON @  $t=0$ ?

- WHAT DIRECTION WILL THE PROTON'S VELOCITY BE SOME SHORT TIME  $\Delta t$  LATER AS A RESULT OF THIS FORCE?

b) Some <sup>SHORT</sup> TIME  $\Delta t < \Delta T$  LATER, THE PROTON IS MOVING IN THE  $+y$  DIRECTION PARALLEL TO  $\vec{E}$ :  
PULSE DURATION

- THE FORCE EXERTED BY THE  $\vec{B}$  FIELD IS NOW NON-ZERO [WHY?].
- IN WHICH DIRECTION DOES THIS FORCE PUSH THE PROTON (R.H.R. #1)?

Q2

a) FROM THE RELATION  $B = \frac{E}{c}$   
& THE FORCE LAWS FOR  $\vec{E}$  &  $\vec{B}$ ,  
DETERMINE THE RATIO  $\frac{F_B}{F_E}$  OF THE  
FORCE ON THE PROTON FROM THE  
MAGNETIC & ELECTRIC FIELDS OF  
AN E.M. WAVE.

• ANSWER IS IN TERMS OF  $c$  &  $v$ .  
SPEED OF LIGHT  $\rightarrow$  PARTICLE'S SPEED

b) WHAT DIRECTION MUST A PROTON\*  
BE TRAVELLING SO THAT THESE FORCES  
POINT IN OPPOSITE DIRECTIONS?

c) HOW FAST MUST THE PROTON BE  
GOING IF THESE FORCES PERFECTLY  
CANCEL? (ASSUME PROTON MOVES IN  
DIRECTION FROM PART (b))

\* DOES YOUR ANSWER CHANGE IF WE INSTEAD CONSIDER AN ELECTRON?

### Q3 ELECTROMAGNETIC SPECTRUM

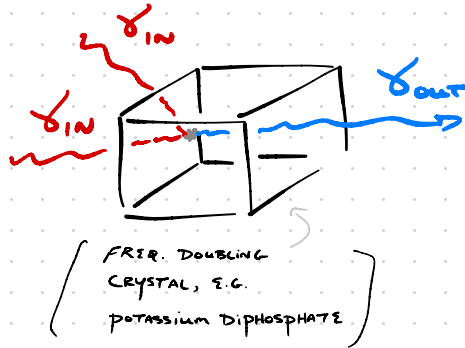

a) AN ANTENNA IS A STRUCTURE WHICH ABSORBS ELECTROMAGNETIC RADIATION [WAVES].

- ABSORPTION IS MOST EFFICIENT WHEN THE LENGTH OF THE ANTENNA IS THE SAME ORDER OF MAGNITUDE AS THE WAVELENGTH OF RADIATION BEING ABSORBED.
- HOW LONG SHOULD YOU DESIGN AN ANTENNA FOR PICKING UP F.M. RADIO, WHICH TRANSMITS @  $\sim 100 \text{ MHz}$ ?
  - COMPARE w/ LENGTH OF TYPICAL CAR HOOD ANTENNA:

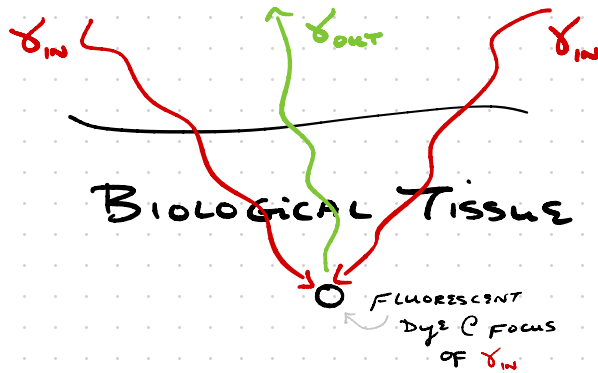

b) A "FREQUENCY DOUBLING CRYSTAL" CAN TAKE TWO PHOTONS OF ONE COLOR AND OUTPUT A PHOTON WHOSE ENERGY EQUALS THE SUM OF THE ORIGINAL TWO:

- IF PHOTON ENERGY IS PROPORTIONAL TO FREQUENCY, THEN WHAT IS THE WAVELENGTH OF THE OUTPUT OF OF A FREQ. DOUBLING CRYSTAL THAT IS GIVEN 1000 nm (INFRARED) LIGHT AS INPUT? IS IT VISIBLE?

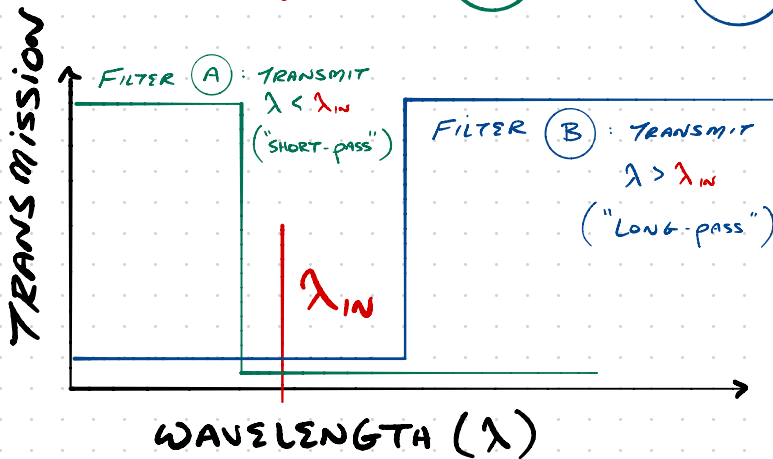

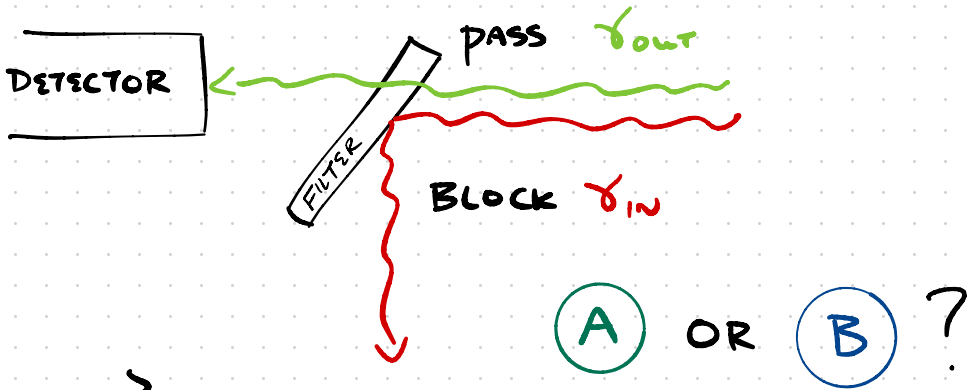

## c) TWO-PHOTON MICROSCOPY

- TWO RED PHOTONS SIMULTANEOUSLY ABSORBED BY FLUORESCENT DYE.
- COLLECT PHOTON ( $\delta_{out}$ ) EMITTED BY DYE. SCAN FOCUS OF INPUT LIGHT ( $\delta_{in}$ ), MONITORING OUTPUT ( $\delta_{out}$ ) TO CONSTRUCT IMAGE OF DYE CONCENTRATION IN BIOLOGICAL TISSUE.

- IF THE ENERGY OF THE OUTPUT PHOTON  $\gamma_{out}$  EMITTED BY THE EXCITED DYE MOLECULES IS GREATER THAN THE INPUT PHOTONS  $\gamma_{in}$ , THEN WHAT FILTER SHOULD WE PUT ON THE DETECTOR SO THAT WE BLOCK THE  $\gamma_{in}^*$  BUT PASS THE  $\gamma_{out}$ ?  
 [RECALL FROM PART (b) THAT PHOTON ENERGY  $\propto$  FREQUENCY]

\* THESE  $\gamma_{in}$  ARE UNDESIRABLE "BACKGROUND" COMING FROM RANDOM SCATTERING IN THE BIOLOGICAL TISSUE. THE  $\gamma_{in}$  ARE TYPICALLY CHOSEN TO BE INFRARED SINCE THESE WAVELENGTHS CAN PENETRATE FAR ( $\approx 1$ cm) INTO TISSUES W/O SCATTERING.

# ANSWERS

Q1 a)

•  $F_B \propto v$ , WHICH IS STILL ZERO

@  $t=0$  BEFORE THE WAVE ARRIVES.

• FORCE ON POSITIVE CHARGE BY  $\vec{E}$  FIELD IS  $\parallel$  TO  $\vec{E}$ :

@  $t=0$

• @  $t = \Delta t$ ,

ACCELERATION DUE TO  $\vec{F}$  PRODUCES VELOCITY

$$\parallel \vec{F} : \vec{F} = m \vec{a}$$

$$\vec{a} = \frac{\Delta \vec{v}}{\Delta t}$$

$$\longrightarrow \Delta \vec{v} = \frac{\vec{F}}{m} \Delta t$$

@  $t = \Delta t$

b)

$$c t = \Delta t$$

R.H.R. #1:

•  $\vec{E}^L$  AND  $\vec{B}^L$

FORCES CONSPIRE TO PUSH

CHARGE ALONG THE E.M. WAVE!

[I.E. PARALLEL TO  $\hat{n}$ ]

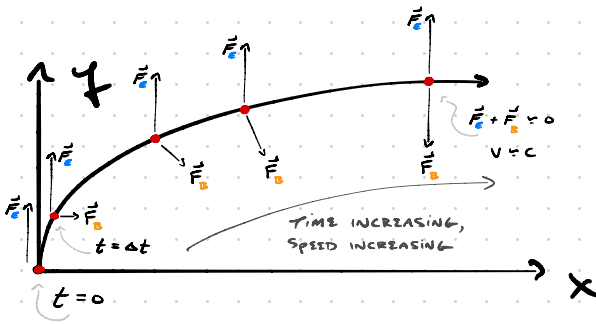

Q2 a) 
$$\frac{F_B^L}{F_E} = \frac{(+e)vB}{(+e)E} = \frac{v \cancel{E}/c}{\cancel{E}} = \frac{v}{c}$$

c) 
$$F_B = F_E \text{ WHEN } \underline{v = c} \text{ [PART (a)]}$$

# Q1 & Q2 WRAP UP:

- SO IF E.M. PULSE IS STRONG ENOUGH, PROTON ENDS UP MOVING PARALLEL TO WAVE w/ VELOCITY APPROACHING  $c$ :

Q3 a)  $f\lambda = c \rightarrow \lambda = \frac{c}{f} = \frac{3 \cdot 10^8 \text{ m/s}}{100 \text{ MHz}}$

b) ENERGY  $\propto f$   
 $= hf$   
"PLANCK'S CONSTANT"

$$= \frac{3 \cdot 10^8 \text{ m/s}}{10^2 \times 10^6 \text{ Hz}}$$

$$= 3 \text{ m}$$

COMPARABLE TO  
CAR ANTENNA.

So if  $E_2 = E_1 + E_1 = 2E_1$

AND  $\lambda_1 = 1000 \text{ nm}$ , THEN:

$$\lambda_2 = \frac{c}{f_2} = \frac{hc}{E_2} = \frac{hc}{2E_1} = \frac{1}{2} \times \frac{hc}{E_1} = \frac{1}{2} \times \frac{c}{f_1} = \frac{1}{2} \times \lambda_1 = 500 \text{ nm}$$

• VISIBLE WAVELENGTHS ARE  $\approx 400 \text{ nm} - 750 \text{ nm}$

• 500 nm is GREENISH BLUE

c) IF  $\gamma_{\text{out}}$  PHOTON IS HIGHER ENERGY THAN  $\gamma_{\text{in}}$ , THEN  $\lambda_{\text{out}} < \lambda_{\text{in}}$ . (PART (b))

• THEREFORE, WE WANT OUR FILTER TO PASS

$\lambda < \lambda_{\text{in}}$  (IS FILTER **A**).
